From: WHO Collaborating Center for
Research, Training and Eradication of Dracunculiasis

Subject: GUINEA WORM WRAP-UP #192

To: Addressees

“Detect Every Case, Contain Every Worm”

Months since last indigenous case of dracunculiasis:

Niger: 10 months, Nigeria: 9 months

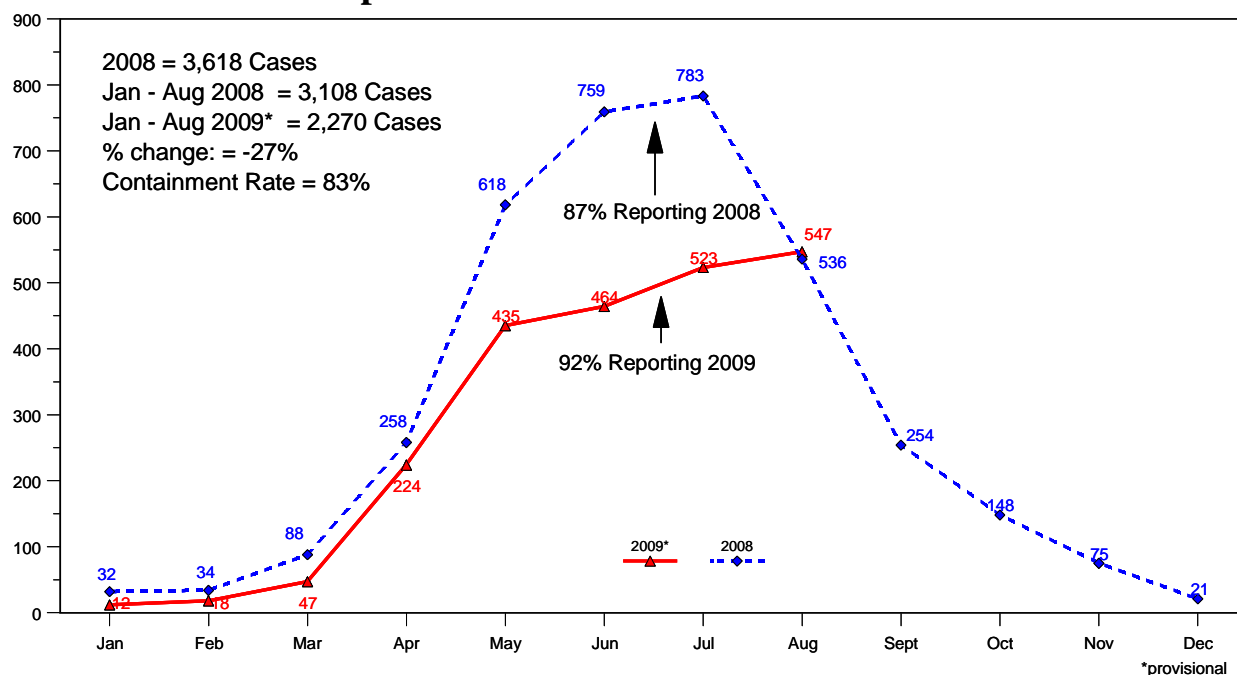

Number of uncontained cases so far in 2009:

Sudan: 391, Mali: 18, Ghana: 15, Niger: 2, Ethiopia: 1, Nigeria: 0

SUDAN: RACING AGAINST TIME

The Southern Sudan Guinea Worm Eradication Program (SSGWEP) continues to work mightily to eliminate the remaining foci of dracunculiasis as soon as possible. During January-August 2009, the SSGWEP has reported a provisional total of 2,270 cases, compared to 3,108 cases during the same period in 2009, a decrease of -27% (Figure 5, Table 2). The case containment rate during this period is 83%. The dramatic improvement in case containment compared to previous reports (49% in 2008) is due to the decision of the SSGWEP to declare all cases contained if all standards for case containment have been met by the end of the reporting month, Figure 1

Number of Reported Cases of Dracunculiasis: Sudan 2008 - 2009*

including for some cases pending complete removal of the worm, the status of which are to be updated in the next monthly report, and partly because the majority of cases in Kapoeta North and South Counties are now being isolated voluntarily in Case Containment Centers. The rate of monthly reporting from endemic villages through August 2009 is 92%, compared to 87% during 2008. As of January - August, 73% of endemic villages are being educated to prevent Guinea worm disease, 91% have cloth filters in all households, 46% have received pipe filters, and water sources in 43% are being treated monthly with ABATE® Larvicide, but only 15% have at least one source of safe drinking water. Figure 2 indicates the four Focal areas in Southern Sudan and the villages reporting cases of Guinea worm disease (GWD) in January-August 2009, and Figures 3 and 4 show the payams reporting 10+ cases during January – August, 2009, grouped according to the four Focal Areas shown in Figure 2.

Unfortunately, increasing insecurity, drought, disputed census results, and impending political milestones in 2010 and 2011 are grave threats or potential risks to the stability that is required for eradicating Guinea worm disease and polio on southern Sudan. A list of the 27 insecurity incidents affecting the SSGWEP so far this year is given in Table 1. The total number of dracunculiasis cases reported in 2008 by these affected areas was 1,931, or 53% of all cases reported from Sudan last year.

“Guinea worm anywhere is Guinea worm everywhere” Alhaji Dr. Mohammed Bin Ibrahim

GHANA: TAKING NO PRISONERS

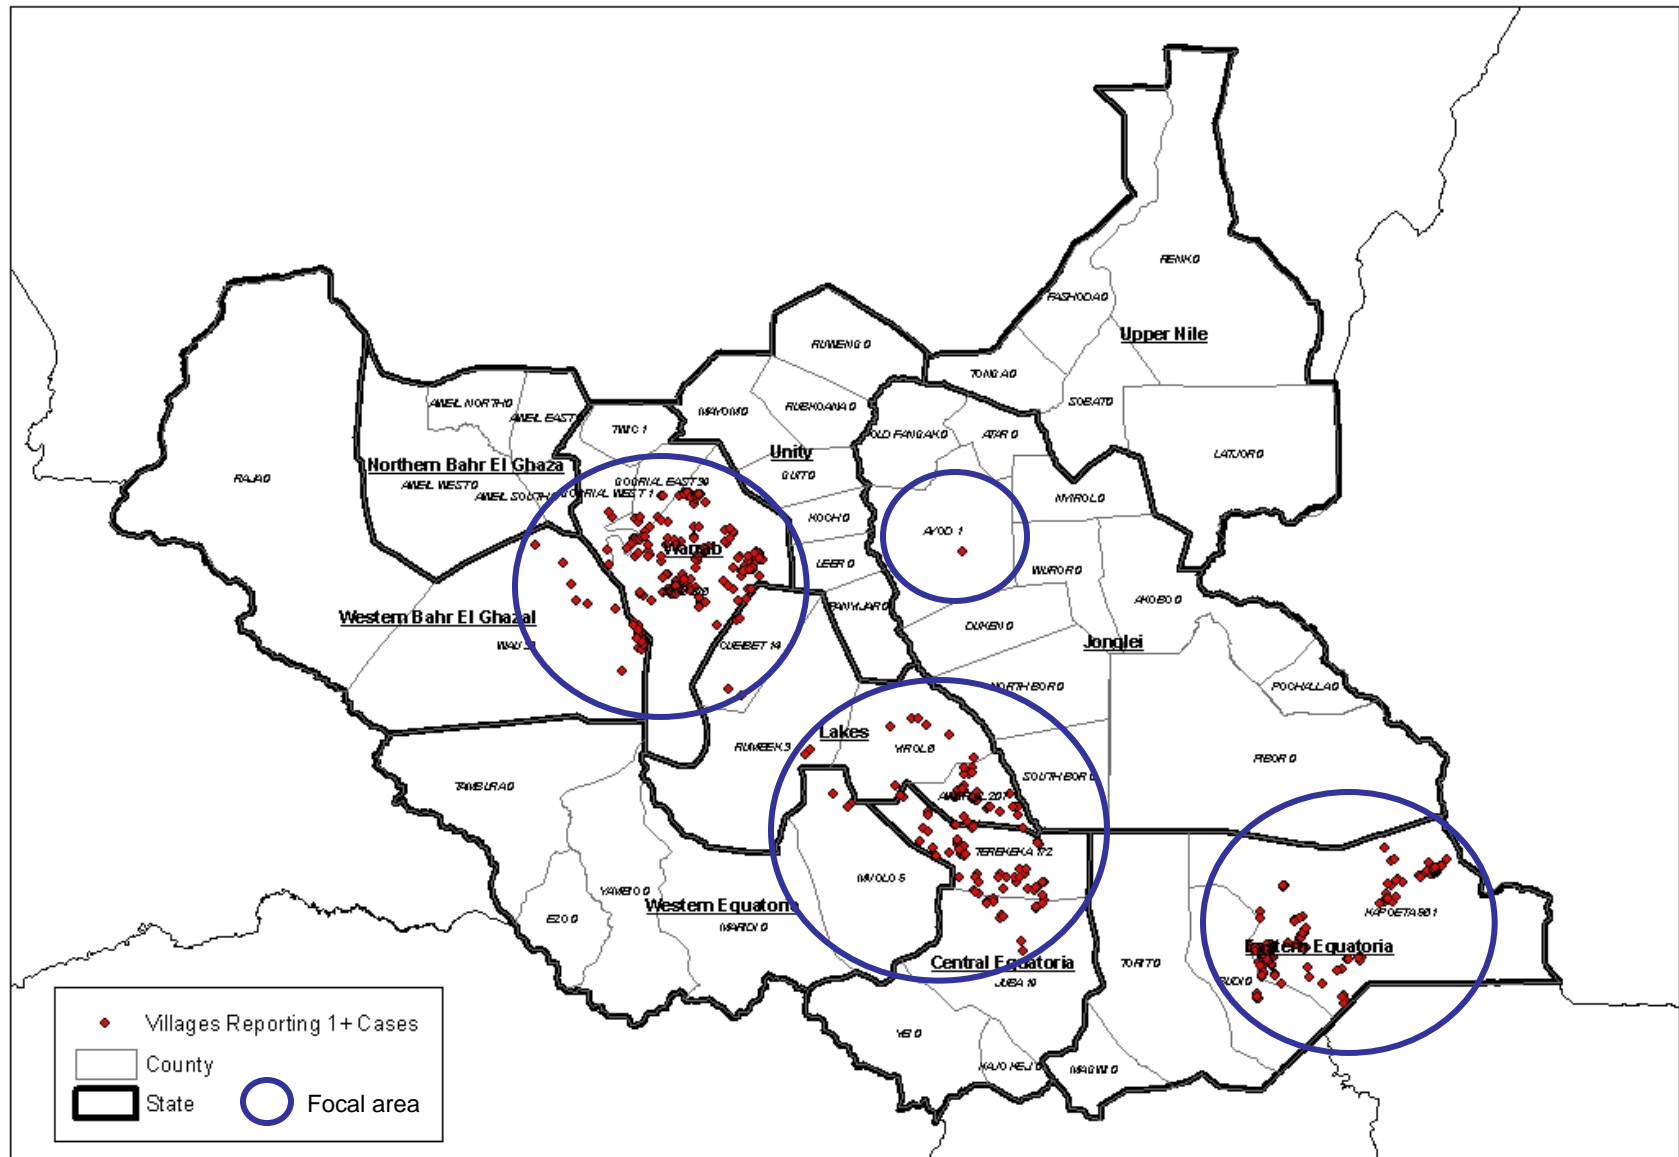

Ghana has reported 236 cases, of which 221 (94%) were contained, during January-August 2009 (Table 2). This is a decrease of -49% from the 459 cases that were reported during the same period of 2008 (Figure 5). Only one case was reported nationwide in August 2009. Fully 180, or 76%, of the cases were detected before or within 24 hours of emergence of the worm and contained in a Case Containment Center. Only 18 villages have reported indigenous transmission in January-August 2009. Eighty six percent of endemic villages have cloth filters in all households, 88% have received pipe filters, all are receiving health education about Guinea worm disease, 47% have been treated with ABATE® Larvicide, and 65% have at least one source of safe drinking water.

MALI: COMBATting THE WORM

Mali reported 74 indigenous cases during January-August 2009, of which 56, or 76% were contained (Table 2). This is a reduction of -71% compared to the same period of 2008 (Figure 5). During January-August 2009, 18 villages have reported one or more cases. This program is tracking the locations of all cases that occurred in 2008, including informing programs in other countries that a former case from 2008 is now residing in their country and should be monitored this year. An important modification of the reward system this year is that patients must agree to be hospitalized in one of the nine Case Containment Centers in order to be eligible for the reward. The security situation in Kidal remains a concern. Mr. Philip Downs, assistant director of The Carter Center’s Guinea Worm Eradication Program, made a supervisory visit to the Mali program on August 2-13, 2009.

(8) Indicates months for which reports were received, i.e., Jan. - Aug. 2009

ETHIOPIA: STRUGGLING FOR SUCCESS

Ethiopia reported 24 indigenous cases (96% contained) during January-August 2009, for a -40% reduction in cases compared to 40 indigenous cases reported during January-August 2008 (Table 2 and Figure 5). All of the cases in 2009 so far have been reported from Gambella Region. An updated line listing is given in Table 3.

IN BRIEF

Nigeria. General (Dr) Yakubu Gowon, former head of state of Nigeria, led an advocacy visit to Ogun and Oyo States between August 31 and September 2, 2009. He thanked the two state governments for their support of Nigeria's Guinea Worm Eradication Program (NIGEP), and urged them to ensure regular publicity to increase public awareness of the need to report any suspected cases of GWD immediately. The General and his entourage, which included the NIGEP national coordinator, the country representative of The Carter Center, as well as representatives of WHO and the state ministries of health, visited a former endemic village in each of the two states.

At a Program Review held in Abuja on September 23-25, NIGEP national coordinator Mrs. Ifeoma Anagbogu reported that NIGEP investigated 169 rumors of GWD in January-July 2009, and that the average rate of monthly reporting from GW-free areas increased from 16% in 2006, to 53% in 2007, 75% in 2008, and 84% so far in 2009.

Niger. Niger has reported one case of GWD that was imported from Mali in September (Table 2). The patient was detected by Niger's GWEP 6 days after emergence of the worm, and the patient admitted contaminating two sources of water. However ABATE@Larvicide was applied in both sources of contaminated water the day following detection of the case. The patient was hospitalized in the district hospital at Tillaberi. This is the second case imported to Niger during 2009. The first case was imported from Ghana in March (Table 2). A third case of GWD was also detected in September, but the origin of infection is being investigated at this time, although the patient's travel history includes at least two endemic villages in Mali. Niger's reward system and hospitalization policies have now been harmonized with those of Mali. Niger has reported no indigenous case of GWD since October 2008.

WHO REPORTS

Kenya. From 29 June to 3 July 2009, a technical and advocacy WHO mission was conducted to Kenya to support the country in preparation for certification of dracunculiasis eradication. The mission was conducted by Drs Alhousseini Maiga and Mubila Likozo of WHO/AFRO.

Togo. From 8 to 14 July 2009, a follow up and technical support mission was conducted to Togo by Dr. Alhousseini Maiga of WHO/AFRO. The main objective of the mission was to advocate for adequate surveillance for Guinea worm disease and for more awareness about the disease, in preparation for certification of eradication.

Note: The case registered in 19.1 is registered uncontained because when the case saw a worm emerging out from her leg she traveled to Elia Clinic to report herself within 24 hours. But on the way to the clinic she washed her wound in the pond water called Lelakugn. She also confirmed that last year she never traveled out of her village.

* provisional

^ imported from another country

Uganda.

From 7 to 21 September 2009 an International Certification Team (ICT) mission was conducted to Uganda to assess the status of surveillance for cases of dracunculiasis. The mission team was led by Dr Joel Breman (USA) who was accompanied by Prof Abolhassan Nadim (Iran), Mr Sadi Moussa (Niger), and Dr Joshua Ologe (Nigeria). The Uganda ICT report will be reviewed by the International Commission for Certification of Dracunculiasis Eradication (ICCDE) during their upcoming meeting from 21-23 October in Geneva.

DONATIONS

In December 2008, the Bill & Melinda Gates Foundation announced a grant of \$40 million to The Carter Center that includes an outright contribution of \$8 million and challenges donor organizations and individuals to provide an additional \$32 million, which the Gates Foundation will match one-to-one. Three donors have provided generous new support toward the challenge grant: the United Kingdom Department for International Development (DFID) pledged £10 million to the Guinea Worm Eradication Program and the Kingdom of Saudi Arabia pledged \$2 million; the John P. Hussman Foundation pledged \$1 million to be split evenly between the Trachoma Control and Guinea Worm Eradication Programs in Southern Sudan.

TRANSITION

Mr. Philip Downs has accepted a position with Research Triangle Institute (RTI) as a Manager of their Integrated Vector Management Program based in Washington D.C. beginning in September 2009. During his eight years of service with The Carter Center, Philip was Senior Program Officer, Dracunculiasis Eradication during 2002-2005, Resident Technical Advisor to Ghana's Guinea Worm Eradication Program during 2005 – 2006, and Assistant Director, Dracunculiasis Eradication during 2006 – 2009. Our best wishes to Philip and his family in his new endeavors.

“Dogs bark, but the caravan moves on.” Anonymous proverb

DEFINITION OF CASE CONTAINMENT

A case of Guinea worm disease is contained if all of the following conditions are met:

1. The patient is detected before or within 24 hours of worm emergence; **and**
2. The patient has not entered any water source since the worm emerged; **and**
3. The village volunteer has properly managed the case, by cleaning and bandaging until the worm is fully removed, and by giving health education to discourage the patient from contaminating any water source (if two or more emerging worms are present, the case is not contained until the last worm is pulled out); **and**
4. The containment process, including verification that it is a case of Guinea worm disease, is validated by a supervisor within 7 days of the emergence of the worm.

MEETINGS

The International Commission for Certification of Dracunculiasis Eradication will meet at WHO headquarters in Geneva on October 21-23, 2009.
